

CONFERENCE HALLS

Functionally, the conference room is designed for internal meetings, the organization of the process of retraining of teaching staff, exchange of experience, including with teachers of other schools and institutions of advanced training. For these activities we propose to provide:

- Simple, clear visualization of the material;
- Audio support for the material presented;
- Teachers' group work with the learning material;
- Opportunity for distant communication and discussion with teachers from other schools and retraining institutes;
- Possibility of technical means for recording such communication with the possibility of further study of the recorded material.

Individual and group video conference solutions

Similar systems can be used for providing the possibility of videoconferencing in the offices of administrators, for example, in the director's office, though desktop terminals in the form of an ordinary monitor are more suitable for individual sessions.

We offer to create a universal working complex designed to solve a wide range of tasks: from meetings and video conferencing with geographically remote participants to distance learning, etc.

Two 55" LCD panels of high resolution are installed in the conference room as the main information display.

In the middle of the hall we place a conference table. There is an interactive tablet installed in the table which, when connected to a computer and LCD-panel enables to write in applications with a special stylus, to access the materials of web-sites and multimedia files and to display information on the screen for public review, enables to control the course of a report remotely, to make corrections and comments.

Additionally the conference room is equipped with a document camera and office equipment in the form of multifunctional device. In the conference hall it is also possible to hold remote courses for retraining of teachers, exchange of experience with teachers from other schools, etc. Without the use of videoconferencing facilities, holding such events is impossible. Therefore, the conference room is equipped with videoconferencing and display facilities.

Videoconferencing equipment is similar to the equipment for "distance learning class". In addition, we equip the conference room with an archive server. This will allow recording videoconferencing sessions and demonstrating the recorded material to all interested parties.

Besides conducting videoconferencing sessions teachers have an opportunity to record video-lessons, which can be placed on the school server for public access. This will allow students to listen to and reinforce the material they have learned or to study the material ahead of the program.
