

DISTANCE LEARNING CLASSROOM

The proposal to equip a distance learning classroom is similar to the proposal to equip a typical classroom. The only difference is that this class has a distance learning function for children with disabilities or those who are in individual education.

The distance learning class will allow you to implement a distance education program for children with disabilities or students with an individual program.

The distance learning class is created on the basis of one of the classrooms. To the equipment described in the "Typical classroom" subsection, videoconferencing equipment, a plasma panel and additional acoustics are added.

The centerpiece of the distance learning classroom is a new generation of video conferencing equipment. This solution offers the highest video quality available today - Full HD format. Built-in multipoint server allows to connect up to 7 subscribers, switching function with voice activation during multipoint communication allows to simplify videoconferencing session management.

The means of displaying remote subscribers is a professional 55" high resolution LCD panel.

These displays are designed for long-term operation. Their service life is at least 50,000 hours. To create the effect of presence of a remote subscriber it is necessary to place acoustic systems on both sides of the plasma panel.
